

THE FOLLOWING FORMULAS MAY BE OF USE IN THIS TEST.

ELECTRICAL

$$\text{Footcandles [lux]} = \frac{\text{lumens}}{\text{area in ft}^2 [\text{m}^2]}$$

$$= \frac{(\text{lamp lumens}) \times (\text{lamps per fixture}) \times (\text{number of fixtures}) \times (\text{CU}) \times (\text{LLF})}{\text{area in ft}^2 [\text{m}^2]}$$

$$\text{Number of luminaires} = \frac{(\text{footcandles}) \times (\text{floor area})}{(\text{lumens}) \times (\text{CU}) \times (\text{LLF})}, \text{ where CU} = \text{coefficient of utilization}$$

LLF = Light Loss Factor

$$\text{DF}_{\text{av}} = 0.2 \times (\text{window area/floor area}) \text{ for spaces with sidelighting or toplighting with vertical monitors}$$

$$\text{volts} \times \text{amperes} \times \text{power factor (ac circuits only)} = \text{watts}$$

$$\text{Demand charge} = \text{maximum power demand} \times \text{demand tariff}$$

HVAC

$$\text{Btu/year} = (\text{peak heat loss}) \times (\text{full-load hours/year})$$

$$\$/\text{year} = (\text{Btu/year}) \times (\text{fuel cost/fuel heat value}) \times (\text{efficiency})$$

$$\text{Btu/h} = (\text{cfm}) \times (1.08) \times (\Delta T) \quad [\text{W} = (\text{L/s}) \times (1.2) \times (\Delta T)]$$

$$1 \text{ kWh} = 3,400 \text{ Btu/h}$$

$$1 \text{ ton of air conditioning} = 12,000 \text{ Btu/h [3.52 kWh]}$$

$$\text{Btu/h} = (U) \times (A) \times (T_d), \text{ where } T_d \text{ is the difference between indoor and outdoor temperatures}$$

$$U = 1/R_t$$

$$U_o = \frac{(U_w \times A_w) + (U_{op} \times A_{op})}{A_o} \text{ where } \begin{array}{l} o = \text{total wall} \\ w = \text{window} \\ op = \text{opaque wall} \end{array}$$

$$U_o = \frac{(U_R \times A_R) + (U_S \times A_S)}{A_o} \text{ where } \begin{array}{l} o = \text{total roof} \\ R = \text{roof} \\ S = \text{skylight} \end{array}$$

$$R = x/k, \text{ where } x = \text{thickness of material in inches}$$

$$\text{DD } ^\circ\text{C} = 0.56 \text{ DD } ^\circ\text{F}, \text{ where DD} = \text{degree days}$$

$$\text{Heat required} = \frac{\text{Btu/h [W]}}{\text{temperature differential}} \times (24 \text{ hours}) \times (\text{DD } ^\circ\text{F [DD } ^\circ\text{C]})$$

$$1 \text{ Btu/h/ft}^2/^\circ\text{F} = 5.678 \text{ W/m}^2/^\circ\text{C}$$

PLUMBING

$$1 \text{ psi} = 2.31 \text{ feet of water} = 6.895 \text{ kPa}$$

$$1 \text{ cubic foot} = 7.5 \text{ U.S. gallons}$$

ACOUSTICS

$$\text{Sound} = \lambda = \frac{c}{f} \text{ where } \begin{array}{l} \lambda = \text{wavelength, ft (m)} \\ c = \text{velocity of sound, fps (m/s)} \\ f = \text{frequency of sound, Hz} \end{array}$$

$$\text{NR} = \text{TL} - 10 \log S/A_R \text{ where } \begin{array}{l} \text{NR} = \text{Noise reduction, dB} \\ \text{TL} = \text{Barrier transmission loss, dB} \\ S = \text{Area of barrier wall, ft}^2 [\text{m}^2] \\ A_R = \text{Total absorption of receiving room, sabins, ft}^2 [\text{m}^2] \end{array}$$

$$\text{NRC} = a/s \text{ where } \begin{array}{l} \text{NRC} = \text{Noise reduction coefficient} \\ a = \text{Total sabins (sound absorbing units)} \\ s = \text{Total surface area in the room} \end{array}$$

$$T_R = K \times \frac{V}{\Sigma A} \text{ seconds where } \begin{array}{l} T_R = \text{Reverberation time in seconds} \\ K = \text{A constant, equal to 0.05 when measurements are in feet} \\ \quad \text{and 0.16 when in meters} \\ V = \text{Room volume, ft}^3 \text{ or m}^3 \\ \Sigma A = \text{Total room absorption, sabins (ft}^2 \text{ or m}^2) \text{ at that frequency} \end{array}$$
